

X AND Y INTERCEPT

At the x and y intercept, values of x and y can be expressed in a certain way. This may assist with finding co-ordinates or the equation of a line.

At the y intercept, when a linear function crosses the y axis, the x value at any co-ordinate along the axis will be zero.

At the x intercept, when a linear function crosses the x axis, the y value at any co-ordinate point along the axis will be zero.
